

MARINE BIODIVERSITY *hub*

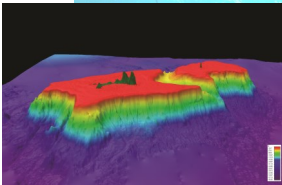

Travelling exhibition of marine images

Ensuring a future for life in Australia's oceans

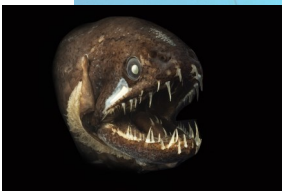

This travelling exhibition contains images from Marine Biodiversity Hub partners (and a few more), and was curated by Mark Norman, Head of Science at Museum Victoria.

Our aim is to reach out to the general public and raise awareness of the beauty and fragility of Australia's marine biodiversity. We also raise the need for cutting edge science and management to protect and sustainably use this environment.

There are 19 images in this exhibition and they include coral reefs, giant kelp forests, handfish, maps of the seafloor, new sharks and stingrays.

(The exhibition opened in the International Year of Biodiversity in 2010 and continues to travel around Australia.)

National Environmental Science Programme

The Marine Biodiversity Hub is a collaborative partnership supported through funding from the Australian Government's National Environmental Science Programme (previously through the National Environmental Research Program and Commonwealth Environment Research Facilities), and administered by the Department of the Environment.

The aim of these programs is to improve our capacity to understand, manage and conserve Australia's unique biodiversity and ecosystems through the generation of world-class research, and its delivery to Australian environmental decision-makers and other stakeholders.
